Multilayer Thin Films Sukumar Basu, 2020-01-15 This book Multilayer Thin Films Versatile Applications for Materials Engineering includes thirteen chapters related to the preparations characterizations and applications in the modern research of materials engineering The evaluation of nanomaterials in the form of different shapes sizes and volumes needed for utilization in different kinds of gadgets and devices Since the recently developed two dimensional carbon materials are proving to be immensely important for new configurations in the miniature scale in the modern technology it is imperative to innovate various atomic and molecular arrangements for the modifications of structural properties Of late graphene and graphene related derivatives have been proven as the most versatile two dimensional nanomaterials with superb mechanical electrical electronic optical and magnetic properties To understand the in depth technology an effort has been made to explain the basics of nano dimensional materials The importance of nano particles in various aspects of nano technology is clearly indicated There is more than one chapter describing the use of nanomaterials as sensors In this volume an effort has been made to clarify the use of such materials from non conductor to highly conducting species It is expected that this book will be useful to the postgraduate and research students as this is a multidisciplinary subject

Multilayer Thin Films Gero Decher, Joseph B. Schlenoff, 2003 Multilayer Thin Films Gero Decher, Joe B. Schlenoff, 2006-03-06 Materials scientists are often faced with the problem of modifying surfaces of objects yet keeping their shape and properties This book provides a detailed survey on the new technology of adsorption from solution for the fabrication of molecularly ordered multicomposite films in order to replace and expand on the well known Langmuir Blodgett technology and to open the field of molecular self assembly to materials and biosciences The book is aimed at scientists who want to integrate several different functional entities in a single device To this audience it presents the technique of layer by layer assembly as today's most powerful key technology which is low cost solution based and very robust It is already beginning to make the transition from academic research into industrial mass production

Multilayer Composites and Manufacture of Same, 2006 The present invention is directed towards a process of depositing multilayer thin films disk shaped targets for deposition of multilayer thin films by a pulsed laser or pulsed electron beam deposition process where the disk shaped targets include at least two segments with differing compositions and a multilayer thin film structure having alternating layers of a first composition and a second composition a pair of the alternating layers defining a bi layer wherein the thin film structure includes at least 20 bi layers per micron of thin film such that an individual bi layer has a thickness of less than about 100 nanometers

Evaluation of Multilayer Thin Films. Phase I. Fred Ordway, ARTECH CORP FALLS CHURCH VA., 1972 Thin films of metals were described by a number of investigators to have extremely high mechanical strength The program is aimed at determining the potential usefulness of composites made up of alternating thin films of a metallic substance and an amorphous nonmetal In this phase of the work methods of specimen preparation measurement and bulge testing to determine mechanical properties were established for thin metallic films and measurements were made of films of aluminum 200 870A thick and of titanium 200 750A thick Estimated ultimate strengths of the aluminum films ranged from 50 to 92 kpsi and those of the titanium films from 93 to 150 kpsi the highest value representing the thinnest film Author

Determination of Optimal Material Combination for Multilayer Thin Films to Improve Performance Against Surface Crack Propagation Sagar D. Bhamare, 2009 Thin films have become technologically important in recent years The mechanical properties of a thin film affect its mechanical behavior and may lead to problems such as surface cracking debonding and buckling In the literature nanoindentation tests have been carried out to measure elastic properties and to check performance against wear In this work the fracture mechanics approach is applied to find the optimal material combination for multilayer thin films which can improve the performance against propagation of surface cracks A stress intensity factor is an important parameter in fracture mechanics which is used to predict failure of thin films in this study Finite element method is used to model these thin film configurations Stress intensity factors are evaluated using displacement extrapolation technique For multilayer films two material variations are studied one has a cosine pattern while other has a step function pattern in thickness direction It is found that increasing the number of material variation cycles in multilayer configurations can help to slow the propagation of smaller surface cracks Both material variations in multilayer films gave similar performance To choose optimal material overall performance of multilayer system is obtained Equations are formed to predict performance within tested range of parameters Reverse analysis is then performed to find the optimal material Analysis yielded a combination which has a hard material of Young's modulus 1000 MPa at the top becoming soft linearly to a material of Young's modulus 800 MPa in contact with the substrate of Young's modulus 500 MPa suggesting the use of functionally graded materials for better resistance to surface crack

propagations **Evaluation of Multilayer Thin Films. Phase II.** Fred Ordway, ARTECH CORP FALLS CHURCH VA., 1973
Thin films of aluminum and titanium alloys on collodion membranes were bulge tested and the strength of the films was calculated. The values obtained for films less than 500 Å thick ranged above 0.5 Mpsi for aluminum and 1 Mpsi for titanium. Unsupported films of aluminum oxide, boron carbide, and silicon nitride were prepared by deposition on a copper foil replica of a glass surface and later dissolving the copper. The strengths of these films were between 4 and 27 kpsi. Author

Evaluation of Multilayer Thin Films Fred Ordway, ARTECH CORP FALLS CHURCH VA., James R. Graves, 1973
Multilayer thin film structures were prepared and tested for strength by the bulge test and in some cases by uniaxial tensile testing on an Instron machine with a specially designed adapter. The calculated strengths of Al_2O_3 metal specimens ranged up to 113 kpsi. Those of aluminum-copper specimens ranged from 47 to 109 kpsi, while thin single films of copper alone gave 138–328 kpsi. Bulge testing of thin blown borosilicate glass gave values of calculated stress and strain lying on straight lines with positive intercepts on the stress axis, and coincidence of curves for increasing and decreasing test pressure showed that the specimens behaved elastically. Author Modified Abstract Multilayer Thin Films Employing Electrostatic Layer-by-layer Self-assembly for Optical Device Applications Soo-Hyoung Lee, 2000 Fabrication and characterisation of multilayer thin film using self assembly of colloidal gold and silica nanoparticles Zaheer Abbas Khan, 2016-06-20. Doctoral Thesis Dissertation from the year 2011 in the subject Materials Science. Asian Institute of Technology. Language: English. Abstract: A novel approach of multilayered thin film based on layer by layer deposition using colloidal nanoparticles was carried out in this work. The films were made by the self assembly of oppositely charged metal and dielectric nanoparticles alternately capped with polymers. Synthesized colloidal suspensions of gold nanoparticles (20 nm) and silica nanoparticles (30 nm) were used as the building blocks for the self organisation of the films. Capping with PDDA and chitosan was used effectively to control the optical absorption of the surface plasmon resonance peaks of the gold nanoparticles. Using different combinations of layer formation, absorption characteristics in the near ultraviolet (NUV), green, and blue region were controlled through capping and varying the thickness of the film. Capping with chitosan or PDDA reduced the absorption peak of the coated silica nanoparticles in a similar fashion. Peak absorption in the UV range was achieved by assembling bare silica nanoparticles layers onto layers of gold nanoparticles. Transmission color was controlled less than 1% color distance per added bi-layer by changing the film thickness. Optical modeling of multilayer thin films constructed with oppositely charged nanoparticles helped us to understand phenomenon such as surface plasmon resonance, absorbance, transmittance, and reflectance. Maxwell Garnett effective medium theory in this case is applied in quasi static limit to multilayer composite consisting of host material (silica) and inclusion material (gold nanoparticles). Maxwell Garnett optical simulations are correlated with experimental spectra obtained for the thin film composites. The thickness of layers, size, and spacing of metal inclusion is varied to alter the optical properties for the required device applications. The multilayered thin film of gold and silica resembles a structure consisting

of large charge sheets of metal separated by a dielectric layer When the applied electric potential reaches a threshold value it drives the electrons to tunnel through the charge sheets producing a rectification effect Therefore current voltage measurements of the multilayer thin films were performed to calculate the threshold voltages The electrical capacitance in these multilayer devices was modified with the change in thickness of the dielectric layers between two conducting layers and calculated by capacitance voltage measurements of multilayer stack
