

The background of the cover features four molecular models of metal complexes. Each model consists of two yellow spheres representing metal atoms, connected by a double bond. These metal atoms are further coordinated to green spheres representing ligands. The models are arranged in a way that suggests a variety of coordination environments and bond types. The title text is overlaid on a dark blue background with a green, irregular shape on the left side.

COTTON, 1993 **Multiple Bonds between Metal Atoms** F. Albert Cotton, Carlos A. Murillo, Richard A. Walton, 2006-07-31

Since the second edition of this book there has been so much published in the field that two points seemed clear One was a sense that a new up to date monograph was needed The other was the reluctance of two or even three people to undertake the daunting task of covering all the ground Our response was to call on others to help and thus to produce the present multiauthored volume Each of the contributing authors was in a position to write authoritatively from hands on research experience We are confident that this has led to a better book than the three of us would have produced As always in a book where different chapters are written by different authors there is some variation in style and we chose not to try to smooth it all out In every chapter the objective has been to be comprehensive if not encyclopedic Putting it a little differently we and the other authors have aimed to mention all pertinent literature references although the amount of emphasis accorded each paper necessarily varies Since the volume of literature to cover is now so large a few topics that might have been included or were in the second edition have been omitted or are covered only in limited detail *Ruthenium Dimers with Multiple Bonds*

Roesky, 1989 The chemistry of rings clusters and polymers is becoming an important branch of inorganic and organometallic chemistry Although inorganic rings have been known for more than 150 years they have only been structurally characterized within the last fifty years Inorganic and organometallic clusters and polymers have recently become the subject of intense interest and study because of their unusual properties and their potential for applications in the areas of catalysis electronics and ceramics Transition metal clusters have been examined as models for heterogeneous catalysts Both rings and clusters might function as potential building blocks for extended solid state systems In comparison with organic polymers however

general and versatile methods for the synthesis of inorganic and organometallic polymers are not readily available In particular the preparation of polymers containing transition metal atoms in the polymer backbone is a challenge to inorganic chemistry This book describes the rapid development which has taken place in this field **The New Encyclopaedia Britannica** ,1974 *Low-coordinate Terphenyl Transition Metal Complexes* (M Chengbao Ni,2009 **Early Transition Metal Clusters with [pi]-donor Ligands** Malcolm H.
