Abstract:- In the last two decades, advances in digital and 3D printing technology, a rise in interest in cosmetic orthodontics, particularly among adults, and manufacturer marketing on a global scale have all contributed to clear aligners becoming a staple in modern orthodontic practise. Clear aligners have seen numerous improvements since they were first introduced with the goal of making orthodontic treatment less obvious. Like many other orthodontic tools, transparent aligners are used to move teeth for alignment and to create healthy, attractive smiles, but they are far more comfortable and aesthetically pleasing. The success of the treatment depends on the therapists' expertise and experience with the aligners, careful case selection, and patients' adherence to the prescribed treatment plans.

Keywords:- *Clear Aligner Therapy, Invisalign, Treatment Effects, Aligners.*

I. INTRODUCTION

Clear aligners have indeed become an increasingly popular alternative to fixed appliance treatment for mild to moderate malocclusions. The concept of clear aligners has a long history starting with Kesling who refined the final stages of orthodontic treatment with tooth positioners¹. In 1971, Poat² introduced the "invisible retainer", which inspired similar appliances by McNamara and Sheridan³. The development of CAD and Rapid Prototyping techniques (Rapid prototyping is a process that involves creating a physical model of a product or design quickly and efficiently. In the context of aligner making, rapid prototyping can be used to create prototypes of aligners for testing and evaluation purposes) allowed an industrial approach to planning orthodontic treatment and manufacturing polymeric aligners^{4,5}. In 1998, Align Technology introduced Invisalign®, a series of removable polyurethane aligners, as an aesthetically appealing alternative to fixed labial braces.

These aligners are custom-made to fit over the patient's teeth and gradually shift them into the desired position over time⁶. However, in recent years, the system has evolved significantly with the introduction of auxiliaries, attachments, and higher fabrication materials, permitting aligners to provide a extra variety of range of motion in much less time. Despite the increasing professional use of clear aligners, questions remain regarding their efficacy, particularly for complex malocclusions⁷. Studies have shown a consistent mismatch between predicted and clinical outcomes, with a discrepancy of around 50%. This requires multiple stages of refinement or added treatment, and many orthodontists report that 70% to 80% of their patients

require midcourse correction, case refinement, or conversion to fixed appliances earlier than the quit of the treatment⁸. Additionally, patients treated with clear aligners have shown more relapse than those treated with fixed appliances, particularly for the maxillary anterior teeth⁹.

In summary, while clear aligners have become a popular alternative to fixed appliance treatment, their efficacy for complex malocclusions remains a subject of debate. The development of new materials and techniques has improved the range of movement that can be achieved with aligners, but their limitations should be carefully considered when selecting an orthodontic treatment option.

Clear Aligners were primarily used to treat minor tooth position irregularities, and treatment outcomes were inconsistent. However, with the introduction of Invisalign in 1998, the field of clear aligner therapy has seen significant development and advancement¹⁰. There are various types of clear aligners, and they differ in terms of their construction method, material, and applicability to different malocclusion therapies¹¹. CAD/CAM technology and 3D printing have also revolutionized the manufacturing process of aligners, resulting in more precise and accurate aligners¹².

The biomechanics of clear aligners are quite different from those of traditional fixed braces. The amount of force applied to the teeth is generally less than that of traditional braces, but the duration of treatment may be longer. The key to successful clear aligner treatment is consistent wear of the aligners, typically for 20-22 hours per day¹³.

While clear aligners offer many advantages over traditional braces, they also have some disadvantages. One major constraint related to clear aligner therapy is the lack of efficacy in treating complex malocclusions, such as severe crowding or skeletal discrepancies. Treatment outcomes for clear aligners has a higher risk of relapse after treatment¹⁴.

Factors that can affect the effectiveness of clear aligner therapy include the type and severity of the malocclusion, the patient's age and compliance with treatment, and the skill and experience of the orthodontist or dental provider. It is important for patients and doctors to carefully consider the pros and cons of clear aligner therapy and consult with an experienced orthodontist or dental provider to determine the most appropriate treatment option for their individual needs¹⁵.

He will know the outcome only after the growth process has ceased that is to say 15 to 20 years hence. For more than a century surgeons have been attempting to find out what to expect. But there are still only a few centers on the globe who can tell us something about long term results. For this reason the interdisciplinary Hamburg Center of Craniofacial Anomalies Cleft Lip Jaw Palate commanding over 30 years of documentation experience continued to uphold the tradition of three previous symposia 1954 1964 1979 by convening the 4th International Symposium inviting teams from malformation centers who can present long term results. For the first time it has been possible to compare various methods in systematic sequence on the basis of late results after cessation of growth. This gives the book pioneer character for 20 years to come.
