Eikemeier,2012-12-06 This volume is the record and product of two International Symposia on the Application of Catastrophe Theory and Topological Concepts in Physics held in May and December 1978 at the Institute for Information Sciences University of Tübingen The May Symposium centered around the conferral of an honorary doctorate upon Professor Rene Thom Paris by the Faculty of Physics of the University of Tübingen in recognition of his discovery of universal structure principles and the new dimension he has added to scientific knowledge by his pioneering work on structural stability and morphogenesis Owing to the broad scope and rapid development of the field the May Symposium was followed in December by a second one on the same subjects The symposia attended by more than 50 scientists brought together mathematicians

physicists chemists and biologists to exchange ideas about the recent fascinating impact of topological concepts on the physical sciences and also to introduce young scientists to the field The contributions covering a wide spectrum are summarized in the subsequent Introduction The primary support of the Symposia was provided by the Vereinigung der Freunde der Universität Tübingen Association of the Benefactors of the University We are particularly indebted to Dr H Doerner for his personal engagement and efficient help with the projects both in his capacity as Secretary of the Association and as Administrative Director of the University

Nonlinear Partial Differential Equations in Geometry and Physics Garth Baker, Alexandre Freire, 2012-12-06 This volume presents the proceedings of a series of lectures hosted by the Mathematics Department of The University of Tennessee Knoxville March 22-24 1995 under the title Nonlinear Partial Differential Equations in Geometry and Physics While the relevance of partial differential equations to problems in differential geometry has been recognized since the early days of the latter subject the idea that differential equations of differential geometric origin can be useful in the formulation of physical theories is a much more recent one Perhaps the earliest emergence of systems of nonlinear partial differential equations having deep geometric and physical importance were the Einstein equations of general relativity 1915 Several basic aspects of the initial value problem for the Einstein equations such as existence regularity and stability of solutions remain prime research areas today eighty years after Einstein's work An even more recent development is the realization that structures originally in the context of models in theoretical physics may turn out to have introduced in important geometric or topological applications Perhaps its emergence can be traced back to 1954 with the introduction of a non-abelian version of Maxwell's equations as a model in elementary particle physics by the physicists C N Yang and R Mills The rich geometric structure of the Yang Mills equations was brought to the attention of mathematicians through work of M F Atiyah J Hitchin
