New Directions In Computational Economics:

New Directions in Computational Economics William W. Cooper, Andrew B. Whinston, 2012-12-06 New Directions in Computational Economics brings together for the first time a diverse selection of papers sharing the underlying theme of application of computing technology as a tool for achieving solutions to realistic problems in computational economics and related areas in the environmental ecological and energy fields Part I of the volume addresses experimental and computational issues in auction mechanisms including a survey of recent results for sealed bid auctions The second contribution uses neural networks as the basis for estimating bid functions for first price sealed bid auctions Also presented is the smart market computational mechanism which better matches bids and offers for natural gas Part II consists of papers that formulate and solve models of economics systems Amman and Kendrick's paper deals with control models and the computational difficulties that result from nonconvexities Using goal programming Nagurney, Thore, and Pan formulate spatial resource allocation models to analyze various policy issues Thompson and Thrall next present a rigorous mathematical analysis of the relationship between efficiency and profitability The problem of matching uncertain streams of assets and liabilities is solved using stochastic optimization techniques in the following paper in this section Finally Part III applies economic concepts to issues in computer science in addition to using computational techniques to solve economic models

Computational Economics Gerald L. Thompson, 1996 **New Directions in Statistical Signal Processing** Simon S. Haykin, 2007 Leading researchers in signal processing and neural computation present work aimed at promoting the interaction and cross fertilization between the two fields Signal processing and neural computation have separately and significantly influenced many disciplines but the cross fertilization of the two fields has begun only recently Research now shows that each has much to teach the other as we see highly sophisticated kinds of signal processing and elaborate hierachical levels of neural computation performed side by side in the brain In New Directions in Statistical Signal Processing leading researchers from both signal processing and neural computation present new work that aims to promote interaction between the two disciplines The book's 14 chapters almost evenly divided between signal processing and neural computation begin with the brain and move on to communication signal processing and learning systems They examine such topics as how computational models help us understand the brain's information processing how an intelligent machine could solve the cocktail party problem with active audition in a noisy environment graphical and network structure modeling approaches uncertainty in network communications the geometric approach to blind signal processing game theoretic learning algorithms and observable operator models OOMs as an alternative to hidden Markov models HMMs

Computational Economics and Economic Theory Kenneth L. Judd, 1997 This essay examines the idea and potential of a computational approach to theory discusses methodological issues raised by such computational methods and outlines the problems associated with the dissemination of computational methods and the exposition of computational results. We argue that the study of a theory need not be confined to proving theorems that current and future computer technologies create new possibilities for theoretical analysis and that by resolving these issues we can create an intellectual atmosphere in which computational methods will make substantial contributions to economic analysis

Books in Print, 1991 **Economic Growth** Alfonso Novales, Esther Fernández, Jesús Ruiz, 2021-12-03 This is the third corrected and extended edition of a book on deterministic and stochastic Growth Theory and the computational methods needed to produce numerical solutions. Exogenous and endogenous growth non monetary and monetary models are thoroughly reviewed. Special attention is paid to the use of these models for fiscal and monetary policy analysis. Models under modern theories of the Business Cycle New Keynesian Macroeconomics and Dynamic Stochastic General Equilibrium models can be all considered as special cases of economic growth models and they can be analyzed by the theoretical and numerical procedures provided in the textbook. Analytical discussions are presented in full detail. The book is self contained and it is designed so that the student advances in the theoretical and the computational issues in parallel. Spreadsheets are used to solve simple examples. Matlab files are provided on an accompanying website to illustrate theoretical results from all chapters as well as to simulate the effects of economic policy interventions. The logical structure of these program files is described in Numerical exercise type of sections where the output of these programs is also interpreted. The third edition corrects a few typographical errors includes two new and original chapters on frequentist and Bayesian estimation and improves some notation

Social Self-Organization Dirk Helbing,2012-05-05 What are the principles that keep our society together This question is even more difficult to answer than the long standing question what are the forces that keep our world together However the social challenges of humanity in the 21st century ranging from the financial crises to the impacts of globalization require us to make fast progress in our understanding of how society works and how our future can be managed in a resilient and sustainable way This book can present only a few very first steps towards this ambitious goal However based on simple models of social interactions one can already gain some surprising insights into the social macro level outcomes and dynamics that is implied by individual micro level interactions Depending on the nature of these interactions they may imply the spontaneous formation of social conventions or the birth of social cooperation but also their sudden breakdown This can end in deadly crowd disasters or tragedies of the commons such as financial crises or environmental destruction Furthermore we demonstrate that classical modeling approaches such as representative agent models do not provide a sufficient understanding of the self organization in social systems resulting from individual interactions The consideration of randomness spatial or network interdependencies and nonlinear feedback effects turns out to be crucial to get fundamental insights into how social patterns and dynamics emerge Given the explanation of sometimes counter intuitive phenomena resulting from these features and their combination our evolutionary modeling approach appears to be powerful and insightful The chapters of this book range from a discussion of the modeling strategy for socio economic systems over experimental issues up the right way of doing agent based modeling We furthermore discuss applications ranging from pedestrian and crowd dynamics over opinion formation coordination and cooperation up to conflict and also address the response to information issues of systemic risks in society and economics and new approaches to manage complexity in socio economic systems Selected parts of this book had been previously published in peer reviewed journals **Environmental Networks** Kanwalroop Kathy Dhanda,Anna Nagurney,Padma Ramanujam,1999 This work presents a basis for environmental policy making in terms of environmental networks This emphasises the spatial nature of economic activity and pollution dispersal It formulates integrated models for analyzing permits and taxes in firms producers and consumers
