**Mediators in the Cardiovascular System** Karsten Schrör,Cecil Pace-Asciak,1995 **Mediators in the Cardiovascular System: Regional Ischemia** Karsten Schrör,Cecil R. Pace-Asciak,1994-12-20 One of the currently most expanding and exciting areas in cardiovascular research is the study of receipt and dispatch of chemical signals by different cell types Major progress has been made during the last years and a number of intercellular mediators have been structurally identified and their regulation studied The impressive developments in molecular biology have provided most effective tools enabling us to understand message generation in much more detail than anyone would have appreciated a couple of years ago These developments also have a major impact on cardiovascular pharmacology This involves both the molecular design of new drugs as well as an improved understanding of how established drugs act Clearly changes in one mediator system will also affect others and it might be difficult to take out just one factor and to ignore others This is definitely true for myocardial ischemia where many different mediators are synthesized and released at about the same time resulting in a complex picture of events and an even more difficult selection of the most appropriate drug therapy *Subject Index of Current Research Grants and Contracts Administered by the National Heart, Lung and Blood Institute* National Heart, Lung, and Blood Institute,1977

**Factor and Related Lipid Mediators** F. Snyder, 1987-08-31 Platelet activating factor PAF is the commonly used name for a group of potent biologically active ether linked phospholipids the alkylacetylglycerophosphocholines. Following the identification of the chemical structure of PAF in 1979 much progress has been made in our understanding of these phospholipid mediators. This is particularly true from the points of view of their molecular structural requirements for expression of biological activity, their biosynthesis and catabolism, their diverse range of biological activities, evidence for their specific receptors at the cell surface, the development of specific antagonists for use in receptor studies and for testing as potential anti-PAF drugs, and implications about their involvement in health and disease. Chapters in this book cover the current status of these general areas of PAF research. Although an enormous amount of information has been published about this interesting new type of phospholipid mediators, questions about their mechanism of action, regulatory controls and the precise role and relative importance of PAF in specific diseases and physiological functions remain to be answered. Since the 1979 discovery the PAF field has brought together scientists from a variety of different biomedical disciplines. The diversity of scientists now in PAF research is very apparent from the number of PAF publications appearing in a wide array of scientific journals ranging from molecular biology to clinical medicine. Publications related to PAF continue to increase at an amazingly rapid rate with the pace reminiscent of the period following the discovery of prostaglandins.
