Control and Standardization of Plant Based Medicines Jiang Xu, Caroline Howard, 2020-06-18 Herbs and herbal products are of paramount importance for human health To be able to guarantee safety and quality standards and testing methods are needed Pharmacopoeias contain quality control protocols setting the standards which are then required by governments The quality traits are many including the intrinsic variables of medicinal plant e.g. the levels of the active compounds and the absence of possibly natural occurring toxic compounds On the other hand many quality traits are related to agricultural conditions and practices or to the harvesting and post harvest processing With so many variables quality control of the end product becomes extremely complex time consuming and costly To ensure the quality of medicinal plants for human consumption quality management the use of good practices at each step from seed to final product becomes a crucial aspect In general quality control includes the inspection of the product's identity purity and content based on its physical chemical or biological properties To ensure the quality of herbal medications criteria such as botanical quality type of preparation physical constants adulteration contaminants chemical constituents pesticides residues et al should be examined Meanwhile authentication of herbs is needed to avoid possible adulteration or contaminating plants even toxic herbs such as Aristolochia species Many of the methods are long standing such as microscopy in combination with color reactions but some 50 years ago chromatography developed as a major tool for both qualitative and quantitative analysis of herbal preparations Nowadays research is working on the improvement of these methods and on the development of novel tools For instance next generation sequencing and mass spectrometry imaging are emerging as new technologies for the quality control of herbal medicines With these technologies quick testing of herbal products and of mixed herbal powder preparations including the testing for specific plant parts botanical drugs can be achieved Also novel chemical tools such as metabolomics and Near Infrared Red NIR spectroscopy are being developed as powerful tools to identify and to link these with activity by using chemometric tools such as multivariate analysis Finally progress of informatic tools such as machine learning helps to

deal with the big data generated by sequencing or mass spectrometry. However, these new technologies like all other new born technologies should be tested and perfected for a broader range of products. **Snake Oil Science** R. Barker Bausell PhD, 2009-07-31. Every year millions of people flock to complementary and alternative therapists offering a vast array of treatments ranging from acupuncture to biofeedback to urine injections. Millions more purchase over the counter alternative medications such as glucosamine, herbs and homeopathic remedies. While consumer motivations for turning to complementary and alternative medicine (CAM) vary, there is one common element among them all: a belief in their effectiveness. This belief appears to be prevalent among all elements of society from scientists and physicians to celebrities such as Prince Charles and Oprah Winfrey to clerical workers and senior citizens. Do these therapies actually work? And if they work, how do they work? This book is about the science of complementary and alternative medicine, about how that science is conducted, how it is evaluated and how it is synthesized to arrive at a bottom line conclusion about whether CAM therapies work. It is also about the phenomenon of the placebo effect and the extent to which it is at play in a given CAM therapy's efficacy. Are CAM therapies in fact nothing more than creatively packaged placebos? In exploring this question, Barker Bausell provides an authoritative and engaging look at the nature of scientific evidence and at the logical, psychological and physiological impediments that can confound such evidence in the world of CAM research. Ultimately, the book is not so much opposed to CAM as to the shoddy science upon which CAM claims are based and, in fact, it closes with a chapter about how one might maximize the placebo effect that Bausell asserts is the main ingredient of most CAM therapies. For general readers, students and professionals (e.g. clinicians) who are routinely asked by their patients for CAM recommendations, the book is a learned, witty examination not just of the scientific process as it is applied to CAM but also of the wonders of the human mind-body system.

Health Care, USA Harry A. Sultz, Kristina M. Young, 2006. During the last few years, components of the health care system in the United States have changed more rapidly than ever before. New industry developments, health insurance changes and major cost increases have significant implications for both providers and consumers. Changes in the Medicare program on which all other service charges are based, double digit premium increases by managed care companies, the growing number of uninsured and a nation wide movement among physicians to set up ambulatory diagnostic, surgical and other treatment centers in competition with hospitals are changing the structure and operation of the U.S. health care system. The 5th edition contains updated service utilization and financial information as well as updated health care industry trends with the latest developments. All existing tables and charts have been updated and new tables and charts have been added to highlight trends and illustrate major points of the narrative.
